Efficient C−B Bond Formation Promoted by N-Heterocyclic Carbenes: Synthesis of Tertiary and Quaternary B-Substituted Carbons through Metal-Free Catalytic Boron Conjugate Additions to Cyclic and Acyclic α,β-Unsaturated Carbonyls [*J. Am. Chem. Soc.* **2009,** *131,* 7253–7255]. Kang-sang Lee, Adil R. Zhugralin, and Amir H. Hoveyda*

Scheme 2 and related discussion. The ^{11}B NMR data originally reported for the NHC·**5** complex are incorrect. The correct values (THF-d_8, −10 °C) are for signals at δ 1.8 (sp^3 B) and 36.3 (sp^2 B), which appear as broad peaks (slow and reversible complexation on the NMR time scale). The signals for NHC·**4** are too weak to measure accurately since, as described in the manuscript, the complex formation is inefficient (large amounts of $B_2(pin)_2$ remain unreacted). The originally reported values correspond to minor impurities in the sample.
